

Before LabStats, we didn't have any way collecting statistics. Since implementing LabStats, we've been able to view real-time reports on our labs. These have helped reduce the numbers of computers in labs where they weren't needed, and to create a map for our students so they can find an open computer quickly and efficiently.

Setting up LabStats just took a little over a day. We were even able to set up a floor plan for LabMaps in that time. LabMaps helped us to know how many seats were needed in a lab, and to justify the numbers of computers we keep in a lab.

We've been able to configure our LabMaps to refresh every 7 seconds on a large screen at the entrance of our medical library, and we've published the map online. LabMaps also allows us to see right away when something is wrong with a computer and to fix the problem in a timely manner.

LabStats support has been great as well. We see the guys from Computer Lab Solutions every time we're at a conference and we always let them know how LabStats is running. They've always provided us with great support and have kept any problems to a minimum.
